WHAT YOU BUILT

An open seat nearby

SlotDrop turns seats released by studios into bookable workshop sessions. For young professionals near Katipunan and nearby Quezon City, the course demo shows what is available in the next 72 hours, when booking closes, and the full party price.

From GC1 to GC2. “Empty slot, better price” started as a broad last-minute appointment idea. GC2 tests a narrower version: studio-released seats in confirmed workshops near Katipunan.

CUSTOMER JOURNEY

The server rechecks availability and price, saves the booking in PostgreSQL, and returns a receipt ID. Confirmation and the Owner dashboard read the saved record.

HOW EACH FEATURE SUPPORTS THE BUSINESS MODEL

Released-seat availability

Studios decide how many seats to release in a class that is already confirmed to run. Browse shows open, eligible sessions and the booking cutoff. Checkout rechecks the available seats before saving, so the studio can sell spare capacity while keeping control of its allocation.

Buddy pricing

A studio can offer a lower per-person rate for two or more people booking together. The server applies the tier and saves it on the receipt. The offer gives customers a reason to invite a friend and lets studios choose which sessions to discount.

Where SlotDrop fits

Versus ClassPass or booking directly with a studio, our pilot focuses on near-term workshop seats with an upfront cash price. The test is whether we bring studios bookings they would otherwise miss.

HOW EACH FEATURE SUPPORTS THE REVENUE STRATEGY

What one booking earns

Worked example from the seeded Laro Ceramics mug-making session. Published reference price PHP 3,000. Simulated standard price PHP 2,700, buddy price PHP 2,565 per person, and four released seats.

Modeled commission ≈ confirmed bookings × average booking value × 10%

RELEASED-SEAT AVAILABILITY

Sell a seat that would have gone empty

Seat left empty	
Customer pays	PHP 0
SlotDrop earns	PHP 0
Studio receives	PHP 0

One standard booking	
Customer pays	PHP 2,700
SlotDrop earns	PHP 270
Studio receives	PHP 2,430

So: Release a small allocation late enough to protect direct sales. If that same guest would have paid PHP 3,000 directly, the studio would give up PHP 570 before differences in channel costs. The server refuses requests that exceed the released seats.

BUDDY PRICING

Will the discount add a guest?

Two buddy seats cost PHP 5,130 and yield PHP 513 in commission and PHP 4,617 for the studio.

Without the buddy offer	SlotDrop fee change	Studio payout change
Both guests would pay standard (PHP 5,400)	-PHP 27	-PHP 243
Only one would book (PHP 2,700)	+PHP 243	+PHP 2,187

Pilot decision

First test small releases on sessions with seats likely to go empty. Keep the buddy offer only where it adds total paid seats and improves studio contribution. Under these two scenarios, the added-guest share must exceed 10% for SlotDrop's fees and about 13% for the studio at an assumed PHP 500 cost per extra guest.

Studio prices are sourced references. Offers, allocations and revenues are simulated. Studio payouts exclude attendance costs. Full sources and assumptions are in docs/business.md.
