SlotDrop / GC2 business summary

Nearby leisure sessions. Released seats. Upfront party prices.

Primary customer hypothesis: young professionals around Katipunan/UP Village, QC, who can pay for occasional leisure and decide within three days. Students are secondary. Weekly supplier schedules do not imply weekly pottery purchases; measure repeat use across activities.

Provider value: distribute a small, dedicated allocation in a class already going ahead. The proposed QC launch catchment is a strategy choice; Makati painting is a separate researched reference, not evidence of a QC supply network.

GC1 anchor	GC2 decision
“Empty slot, better price.”; cancelled/empty slots (pp.1–2)	A released allocation and a provider-controlled offer. No guarantee that attractive studios have spare seats.
Only upcoming available slots (p.6)	Eligibility intersects start <72 hours, cutoff, status, confirmed-to-run and quantity.
Commission / featured placement feedback (p.1)	Model 10% commission on accepted booking value; featured placements deferred. No partner-approved fee.

Two revenue features, enforced and persisted

Availability: server-filtered allocations, per-session deadlines and a locked stock check at save. Buddy tier: optional stored rate for 2+ seats in one booking. The quote/save service chooses the tier and stores quantity, price, fee and payout; the browser cannot choose its own total.

Worked example / real price, simulated offers

Laro advertises mug-making + painting at PHP 3,000. Sample standard PHP 2,700; sample buddy PHP 2,565; four allocated seats; model 10% fee. No offer, allocation or partnership is agreed by Laro. Figures exclude operating/attendance costs.

Booking	Customer total	Platform fee	Provider proceeds
1 standard seat	PHP 2,700	PHP 270	PHP 2,430
2 standard seats	PHP 5,400	PHP 540	PHP 4,860
2 buddy seats	PHP 5,130	PHP 513	PHP 4,617

If both would buy standard, buddy reduces provider proceeds by PHP 243 and fees by PHP 27. If one seat would otherwise be empty, it adds PHP 2,187 in provider proceeds; enable only if incremental costs are lower and other sales are not displaced. Demand, cost and acceptance data remain unmeasured.

Flow, rules and decisions

Home → Browse → Detail → Selection → Checkout → saved Confirmation. Owner reads the same saved booking. Browse compares feasible sessions; Detail resolves facts/deadlines; Selection quotes quantity; Checkout accepts a server total; Confirmation reloads by ID. Conversion events are proposed measures, not implemented analytics.

Rule	Enforcement / customer result
Eligible inventory only	listSlots(): active, open, confirmed-to-run, future start/cutoff, strictly inside 72h; exclude insufficient allocation.
Different business cutoffs	createOffer()/editOffer(): service default or explicit session override. Require now < cutoff < start; do not rewrite old sessions.
Never oversell	Booking and capacity edits lock the same slot row and count confirmed quantities; insufficient seats →409.
Authoritative price	quoteFor(): integer centavos; stored buddy iff quantity≥2 and enabled. Changed accepted total →409 and fresh acceptance.
Safe retry	Unique request_id + exact normalized payload. Same request →200 original; different payload/key reuse →409.
Stable, private receipts	Save price/time/fee snapshots; GET by ID reloads them. Public list/POST/GET omit contacts and retry keys.

Owner metrics / decision and reconciliation

After one two-seat buddy booking: bookingCount 1 (orders, not seats); fees PHP 513 (gross commission, not profit); AOV PHP 5,130 (compare party mix); top service Laro mug, 2 seats (guide supply only after real use); nearly full 0 (2/4 remain). Add one standard seat: 2 bookings, PHP 783 fees, PHP 3,915 AOV, top service 3 seats, nearly-full count 1 (1/4 remains). Paused/expired inventory leaves the nearly-full set; saved confirmed receipts still count.

Structure and evidence limits

UI → routes → services/repositories → PostgreSQL. Five tables: providers, services, slots, bookings and private pending provider_applications. Eight sourced activities, five real businesses, sixteen sample sessions. Additive migrations preserve prior receipts. Standard/buddy offer money is centralized; secrets remain in environment variables. Research sources are official; all session dates, seat allocations, cutoffs, discounts, payments and bookings are simulated. Core Pilates remains research-only.

Studio applications use Apply → Review → Set up. Saving pending status neither verifies representation nor publishes a page. Verified accounts, real payments, calendar sync and settlement are future work. Official group code still requires teammate review; the private reference does not replace contribution gates or prove customer demand.
